Tdap-IPV Vaccine

Combined tetanus, diphtheria, pertussis (whooping cough) and poliomyelitis vaccine

Vaccination, the best protection

By having your child vaccinated, you are protecting him or her against tetanus, diphtheria, whooping cough, poliomyelitis and their complications.

Diseases	Signs and symptoms	Possible complications
Tetanus	Muscle spasms in the jawVocal chords spasmsMuscle spasms throughout the body	Respiratory and cardiac problemsDeath (10 to 80% of cases)
Diphtheria	Serious sore throat High fever Respiratory problems	Cardiac problemsParalysisDeath (5 to 10% of cases)
Whooping cough	 Violent fits of coughing that can persist for months Difficulty eating, drinking and breathing 	 Ear infection Pneumonia Convulsions Brain damage (1 case in 11,000) Death, especially before the age of 3 months
Poliomyelitis	Fever Nausea and vomiting Discomfort Intense muscle pain	Paralysis of the arms and legs (1% of cases) that can become permanent Respiratory problems Death (2 to 5% of children and 15 to 30% of adults with paralytic poliomyelitis)

IMPORTANT

It's up to you to make an appointment with the CLSC or with your doctor to have your child vaccinated.

Next appointment for vaccination:

Information on the Tdap-IPV Vaccine

Vaccination is the best protection against tetanus, diphtheria, whooping cough, poliomyelitis and their complications. In general, Tdap-IPV vaccine is given to children before they start school. This vaccine is also given to people aged 4 and older who requires protection against these 4 diseases.

Some symptoms may be caused by the vaccine (e.g. redness at the injection site). Other problems may occur by chance and are not related to the vaccine (e.g. cold, gastro, headache).

Tdap-IPV vaccine is safe. Most reactions are harmless and do not last long.

Frequency	Possible reactions to the vaccine	What to do
In most cases (more than 50% of children)	Pain at the injection siteFatigue, headache	
Very often (less than 50% of children)	Pain and swelling at the injection siteDiscomfort, dizziness, nausea, diarrhea, shivering	
Often (less than 10% of children)	 Fever Loss of appetite, vomiting Irritability, drowsiness (sleepiness) Skin rash Swollen lymph nodes 	 Apply a cold, damp compress at the injection site. Use a medication for fever or discomfort if needed. See a doctor if symptoms are severe.
Sometimes (less than 1% of children)	Small lump for a few weeks at the injection site	
Very rarely (less than 1 child in 10,000)	Sterile abcess at the injection site	

We recommend that you stay at the clinic for at least 15 minutes after vaccination because allergic reactions may occur. If an allergic reaction occurs, the symptoms will appear a few minutes after the vaccination. The person giving the vaccine will be able to treat this reaction immediately.

FOR ANY QUESTIONS,

contact the person giving the vaccine, or Info-Santé 811 or your doctor.
