Québec Pandemic Influenza Plan – Health Mission
QUÉBEC PANDEMIC INFLUENZA PLAN – HEALTH MISSION
A WORD FROM THE MINISTER

Like the World Health Organization, the federal government and other Canadian provinces, Québec is preparing to deal with an influenza pandemic. More than at any other time in human history, we know that complex emergency situations can quickly become social crises that mark an entire generation. The Spanish flu, for example, which occurred at the beginning of the last century, is still part of our collective memory. An influenza pandemic could seriously disrupt our society, and it is our duty to prepare ourselves for it.

We know that the consequences of an influenza pandemic extend beyond the confines of the health and social services network. An influenza pandemic could affect not only the health and well-being of the public, but also the economy, education, recreation, visits to cultural sites, in short, every aspect of our day-to-day lives.

As the government, in close cooperation with members of the health and social services network and their partners, we will do our utmost to limit the transmission of the virus, to treat those infected and to guide the public in the event of a pandemic. In this type of emergency situation, we will work to make sure that people continue to have the access they need to services, to intervene with regard to social disruptions and the psychosocial aspects of such a situation to the best of our ability, and to reduce morbidity and mortality. To do this, we will create conditions that make the work of health and social services staff easier and safer, and we will develop strategies to ensure that enough qualified labour is available.

The first challenge is preparing for an event whose scope and timing are unknown. The principles, strategies and activities presented in this plan point the way for regional agencies and health and social services establishments as well as for partners, community organization and other bodies of the Government of Québec, who will all make their own preparations.

Based on this document, regional health and social services agencies and local establishments will arm themselves with a plan that presents the structure for dealing with an influenza pandemic, each at their level of responsibility. These plans will build upon the emergency measures plans that already exist within the health and social services network.

In closing, I would like to invite the members of the health and social services network and their partners—workers, professionals, physicians, various community resources—to continue to mobilize and prepare the fight against an influenza pandemic. The more united and effective we are in these preparations, the more ready we will be for any eventuality, no matter how serious the pandemic.

Philippe Couillard, Minister

17
THE THREE COMPONENTS OF ACTION

1. Preparedness
2. Response
3. Recovery

The phases established by the World Health Organization
The links between the phases set out by the World Health Organization and the components of action

HOW TO READ THE DIVISION OF RESPONSIBILITY TABLES

CHAPTER 1

BASIC CONCEPTS IN THE FIGHT AGAINST AN INFLUENZA PANDEMIC

THREE PRINCIPLES OF RESPONSE

FIRST PRINCIPLE: STRATEGIES THAT MATCH THE FUNCTIONS OF THE NETWORK
SECOND PRINCIPLE: ADOPT A TOP-DOWN DECISION-MAKING PROCESS
THIRD PRINCIPLE: DELIVER A HIGHLY EFFECTIVE ORGANIZATION

The ministerial coordination structure
The strategic management unit
Operations Branch
Coordination structure of the health and social services network
Coordination with ministerial partners
Coordination of emergency preparedness
Ties with emergency preparedness

FOUR GROUPS OF STAKEHOLDERS

Citizens
Informal caregivers
Workers
Decision makers

THREE RULES OF GOVERNANCE

Protection
Solidarity
Responsibility and sound management
CHAPTER 2
STRATEGIES

The purpose of the strategies 31
Strategies for dealing with the five areas of activity addressed by the network’s mission 31

SECTION ONE : PROTECT THE HEALTH OF THE POPULATION (PUBLIC HEALTH) 31

STRATEGY NO. 1: CONDUCT EPIDEMIOLOGICAL MONITORING AND SURVEILLANCE 31
Surveillance based on the three pandemic periods 32

STRATEGY NO. 2: APPLY MEASURES TO PREVENT AND CONTROL INFECTIONS 37
Prevent the spread of the infection 37
Tailoring guidelines to the reality of the pandemic 37
Implementing measures outside establishments 37
Actions timed according to the periods of the influenza pandemic 37

STRATEGY NO. 3: USE ANTIVIRALS FOR PREVENTIVE PURPOSES 40
In the absence of a vaccine … 40
The limits of antivirals 40
Priority groups first 40

STRATEGY NO. 4: VACCINATE THE POPULATION 44
The most effective means 44
Vaccinate the priority groups while awaiting vaccines for everyone 45
Vaccines for everyone 45
Mass vaccination centres 45
Actions timed according to the periods of the influenza pandemic 45

STRATEGY NO. 5: IMPLEMENT PUBLIC HEALTH MEASURES 50
Health education 50
Controls at the community level 50
Limiting public gatherings 51
Special measures for travellers 51
Case and contact management 54
Case management 54
Contact management 54
SECTION TWO: PROVIDE MEDICAL CARE (PHYSICAL HEALTH)               57

STRATEGY NO. 6: ACT UPSTREAM OF ESTABLISHMENTS THROUGH SELF-CARE ______ 58
A self-care guide                                                   58
Home: the first site of care                                        58

STRATEGY NO. 7: ADAPT HOME SUPPORT SERVICES_________________________ 59

STRATEGY NO. 8: ENSURE ACCESS TO INFO-SANTÉ AND INFO-SOCIAL___________ 61

STRATEGY NO. 9: SET UP PREHOSPITAL EMERGENCY SERVICES_______________ 63

STRATEGY NO. 10: COORDINATE THE DELIVERY OF HEALTHCARE______________ 65
Front-line services                                               66
Emergency units and services                                      66
Hospital activity                                                 66
Critical care                                                     66

STRATEGY NO. 11: TREAT PATIENTS USING ANTIVIRALS____________________ 69

STRATEGY NO. 12: DEPLOY NON-TRADITIONAL HEALTHCARE SITES_____________ 71

STRATEGY NO. 13: DISPOSE OF REMAINS EFFECTIVELY_____________________ 72

SECTION THREE: ENSURE PEOPLE’S PSYCHOSOCIAL WELL-BEING
(PSYCHOSOCIAL RESPONSE)                                           74

STRATEGY NO. 14: COORDINATE PSYCHOSOCIAL SERVICES___________________ 74

STRATEGY NO. 15: IDENTIFY PATIENT GROUPS ___________________________ 76
Anxiety of the public                                              76
The most vulnerable people                                         76
Identifying affected people in the network and among the public______ 77

STRATEGY NO. 16: PROVIDE SERVICES TAILORED TO THE SITUATION__________ 78
Clinical supervision                                               80

STRATEGY NO. 17: PROVIDE THE POPULATION AND PARTNERS WITH ADVICE______ 81
SECTION FOUR: PROVIDE CLEAR, PERTINENT AND MOBILIZING INFORMATION (COMMUNICATION)  

STRATEGY NO. 18: ENSURE HEALTH AND SOCIAL SERVICES NETWORK RESOURCES AND PARTNERS ARE WELL INFORMED  

STRATEGY NO. 19: INFORM THE POPULATION AND RAISE AWARENESS  

STRATEGY NO. 20: MOBILIZE THE NETWORKS  

STRATEGY NO. 21: CREATE COMMUNICATION INFRASTRUCTURES DEDICATED TO THE FIGHT AGAINST THE INFLUENZA PANDEMIC  

| Strategic Communications Coordination Unit | 101 |
| Communications Operations Centre | 102 |

SECTION FIVE: KEEP THE NETWORK WORKING (CONTINUITY OF SERVICES)  

STRATEGY NO. 22: MANAGE WORKER MOVEMENT  

| Anticipate personnel shortages | 106 |
| Recruit alternate human resources | 107 |
| Compensation and working conditions for alternate human resources | 107 |
| Status | 107 |
| Employees and working conditions | 107 |
| Management staff | 108 |

PREFACE

BACKGROUND

AN INFLUENZA PANDEMIC ON THE HORIZON

An influenza pandemic is an event of international proportions involving considerable preparation. An influenza pandemic can seriously disrupt the lives of individuals and the workings of society through mortality, morbidity, psychosocial impacts, not to mention repercussions in the economic and financial sectors.

The experience with severe acute respiratory syndrome (SARS) and the recent natural disasters in Asia and New Orleans bear witness to the necessity of being able to depend on emergency measures plans that are integrated and available at the appropriate time. These crises also spotlight international relations, which, in practical terms, means that as soon as a pandemic is declared, all countries will be facing the same situation.

All groups of stakeholders—citizens, informal caregivers, workers, key decision markers, elected local officials and deputies—must be actively involved in the preparation process. For the first time in history, scientific monitoring systems are helping us anticipate the next influenza pandemic. Consequently, it is imperative that we work together to be better prepared.

THE PURPOSE OF BASIC PRINCIPLES AND STRATEGIES

The Québec Pandemic Influenza Plan—Health Mission (QPIP-HM) details the issues surrounding an influenza pandemic and its potential effects on the health and social services network as well as on society. It sets out the broad lines of the health mission’s planning, the basic principles of response, some 20 strategies, and a series of activities to be undertaken at the provincial level.

Based on Québec’s Plan, regional health and social services agencies will then develop a Regional Pandemic Influenza Plan (RPIP), after which each establishment will prepare a specific plan in line with its mission. All of these plans will not only complement the health and social services emergency measures plans at every level (provincial, regional and local) but will also be coordinated with the broader emergency plans that cover other government missions, most of which are included in the Québec National Civil Protection Plan (QNCPP).

WHY MAKE SUCH AN EFFORT TO GET READY?

For one thing, the risk of an influenza pandemic is real. What is more, the expected consequences of a pandemic on the health and well-being of Québec’s population are likely to be serious.

THE RISK OF AN INFLUENZA PANDEMIC IS REAL

An influenza pandemic is an influenza epidemic that is limited in time but not in space, affecting populations over several continents. Phenomena of this kind can have devastating effects.

Last century, there were three influenza pandemics, all of which originated in birds: the “Spanish flu” in 1918-1919, the “Asian flu” in 1957-1958 and the “Hong Kong flu” in 1968-1969.

Historical data shows that a new pandemic strain of the influenza virus emerges every few decades. Although it is impossible to accurately predict when a new strain will emerge, the probability of that happening increases when certain conditions arise at the same time. Experts agree that an influenza pandemic is becoming ever more likely, with three of the four conditions required for a pandemic virus to emerge already in place.
FIRST CONDITION: THE APPEARANCE OF A NEW STRAIN

The first condition required for an influenza pandemic to develop is the emergence of a new virus strain against which humans do not have any immunity.

The type A influenza virus, unlike types B and C, satisfies this condition due to its genetic instability. Wild birds, especially ducks, are considered the primary natural reservoir of the virus, which they can transmit to other domestic animals and potentially to humans.

Transmission of the avian virus to a person who already has the human influenza virus may facilitate the exchange of genetic material between the two viruses. This kind of genetic reassortment can lead to the appearance of a new type of mutant virus able to adapt more easily to humans, making effective human-to-human transmission possible.

The virus could also mutate and become a human pathogen without genetic reassortment, which is what happened in the pandemic of 1918.

These "possibilities" are the backdrop for the many concerns being raised by the H5N1 influenza virus that can be transmitted from birds to humans.

SECOND CONDITION: HUMAN VULNERABILITY

A virus is a threat to a person who has never been exposed to that particular virus or was exposed to it a very long time ago.

The H5N1 influenza virus infected 18 people in Hong Kong in 1997, resulting in six deaths. This was the first documented transmission of the H5N1 strain between birds and humans. Since then, similar cases have been reported in Asia, namely in Thailand, Cambodia and Vietnam and, more recently, in Europe, specifically in Turkey. To date, there is no evidence from documented cases of human-to-human transmission, even if the possibility of transmission between members of the same family is suspected in rare cases. One thing is certain: in almost all the human cases of H5N1, there was direct, close contact between the victims and the birds.

THIRD CONDITION: VIRULENCE

To provoke a pandemic, a new influenza strain must be virulent enough to quickly affect the body and result in complications that may lead to death. In the cases we currently know about, infection with the H5N1 virus leads to serious complications and death in a high percentage of those infected.

Another particular sign of the virus's virulence is that the infection does not only affect people who are vulnerable. The Spanish flu of 1918-1919 caused a significant number of deaths among healthy people in the prime of life. The other two pandemics of the 20th century also affected people under 65 years of age in large proportions. Statistically speaking, 36% of the people who died during the 1957 pandemic were under 65 years old; during the 1968 pandemic, this number rose to 48%.

FOURTH CONDITION: EFFECTIVE PERSON-TO-PERSON TRANSMISSION

Finally, there is a fourth condition, which has not yet come into play: an influenza pandemic is only possible if there is effective person-to-person transmission of the virus. This is what happens with the regular flu as we know it. It is easily transmitted through the inhalation of the fine particles or droplets suspended in the air when an infected person coughs or sneezes. It also spreads through direct contact with an infected person’s secretions and contact with contaminated objects.

The dreaded H5N1 virus does not currently have this transmission capability. The cases that have been documented are all attributable to close human contact with birds. However, a mutation in this virus could make it easily transmittable from person to person and dramatically change the course of events.

1. See Appendix A to learn more about the influenza virus.
THE EFFECTS OF AN INFLUENZA PANDEMIC ON SOCIETY

An influenza pandemic has a strong potential to cause individual and psychosocial disruptions affecting people, spouses, families, work and education environments, cultural and recreational gatherings—in short, all of society's activities would be affected to an unpredictable degree, as would the population's physical and psychosocial health.

Here are a few points to consider:

- due to the volume and frequency of international travel, pandemic activity will spread rapidly around the globe;
- the influenza pandemic will affect all areas of the country, making it unfeasible to depend on help from an external source;
- a significant number of ill people will require hospitalization or medical consultation, and a large number of ill people will remain at home, while the health network will experience a personnel shortage;
- reserves of specific drugs may not be sufficient to meet needs, and the vaccine will probably not be available for the first wave of the pandemic;
- a health crisis has the potential to cause major social disruptions;
- the public will have to deal with a number of psychosocial impacts;
- the global cost of a pandemic will almost certainly be several billion dollars.

A REALISTIC BUT CONSERVATIVE FORECAST

For planning purposes, the Ministère in Québec has adopted the hypothesis that the first wave of an influenza pandemic would affect 35% of the population, over a period of eight weeks. In this model,

- 2.6 million people would be infected;
- 1.4 million people would need to consult a healthcare professional;
- 34,000 people would require hospitalization;
- 8,500 people may die.

A SCENARIO THAT IS DIFFICULT TO PREDICT

Due to the volume and frequency of international travel, pandemic activity will spread rapidly around the globe. It is reasonable to think that a first wave of infection in Canada would be observed three to four months after a new pandemic viral strain emerges.

The first wave may be followed by a second wave, three to nine months later. Further successive waves are possible and would last anywhere from a few weeks to a few months.

A VACCINE IN THE OFFING

Vaccination is the best means of preventing influenza and avoiding the complications associated with it. Once the viral strain is identified, however, it may take three or four months, and perhaps longer, to produce a vaccine. The areas of the world exposed to the infection early on will not have a vaccine at their disposal to fight the first wave of the pandemic. In Canada and Québec, delaying the onset of the pandemic by a few months may enable us to have access to a vaccine. This scenario is possible, at least in theory.

Once a vaccine has been developed, it would only be made available gradually. Therefore, it is important to keep things in perspective: only basic means of prevention, such as handwashing, the judicious use of antivirals, close surveillance to raise the alarm and keep outbreaks under control, and a well-organized healthcare network, will contribute to stemming the spread of the infection.
THE IMPORTANCE OF GETTING READY

While it is difficult to predict the impact that an influenza pandemic would have on the health and well-being of the Québec population, it is possible to make certain hypotheses that would enable the public and the health and social services network to prepare for such an eventuality.

CHALLENGES IN HEALTH AND SOCIAL SERVICES

The wide and rapid spread of influenza among the Québec population will create some major challenges for the health and social services network, its partners and other stakeholders.

Among the more obvious challenges are those related to:

- absorbing increased patient traffic at sites that dispense first-line healthcare and services, such as private clinics, emergency rooms at hospital centres, etc.;
- ensuring the continuity of emergency and other services that the health and social services network delivers to the population;
- properly managing health and social services network personnel in regard to absences due to illness, the presence of people who are ill among the personnel’s friends and family, and compensation for the work overload that certain employees will experience. As in the general population, absenteeism among the network’s workers could reach 30% to 35%, which is significant in a context where there is already a shortage of professionals in certain areas of practice;
- coordinating a variety of activities with the partners of the health and social services network and in the area of emergency preparedness;
- procuring drugs, supplies and equipment at a time when many countries will also be needing the same products;
- communicating accurately and effectively with health and social services network workers and with a population that demands no less than to be well informed during an influenza pandemic.

Rising to challenges such as these involves dealing with the demand for services arising from the population, ensuring the organization within the network of services for responding to that demand, and managing labour and material resources. The Québec Pandemic Influenza Plan—Health Mission has been devised to meet these challenges.

WHO IS THE QUÉBEC PANDEMIC INFLUENZA PLAN—HEALTH MISSION FOR?

The Québec Pandemic Influenza Plan—Health Mission will guide the workers of the health and social services network in carrying out response plans according to the roles and responsibilities handed down to them, thereby helping to ensure an effective, coordinated and coherent response to a pandemic.

It will also serve as a reference for the population, our partners and related bodies, such as regional emergency preparedness organizations and the other missions of the Québec government, local elected authorities and deputies.

PLAN UPDATES

The Québec Pandemic Influenza Plan—Health Mission as well as the plans drawn up by regional health and social services agencies and the establishments will be updated as knowledge is acquired and epidemiological observation of the infection progresses.
LEGAL CONSIDERATIONS

An influenza pandemic involves response actions that concern a number of laws. The main laws involved are:

- the *Act respecting health services and social services*;
- the *Public Health Act*;
- the *Civil Protection Act*;
- the *Act respecting occupational health and safety*;
- the Charter of human rights and freedoms.

There are also collective agreements that apply to the various groups involved.

THE THREE COMPONENTS OF ACTION

In the *Québec Pandemic Influenza Plan—Health Mission*, the Ministère has adopted three of the four components of action in the classification recognized by the *Organisation de la sécurité civile du Québec* and applicable to disaster situations: preparedness, response and recovery. Prevention, which is the first component of action, does not apply to a pandemic, since it cannot be prevented. The only thing we try to do is delay its spread.

1. PREPAREDNESS

As its meaning indicates, preparedness refers to the period before a pandemic is declared. It includes all the actions involved in anticipating the pandemic’s onset, preventing it, and searching for ways to mitigate its potential repercussions—basically everything involved in getting real to deal with a pandemic.

2. RESPONSE

Exactly when a sector will be required to undertake response activities will depend on its specific function. Consequently, sectors whose mandate is to protect the health of the population, provide clear, relevant and mobilizing information, and ensure people’s psychosocial well-being will initiate response during the alert period and then intensify it in various phases. Response activities that involve providing medical treatment and keeping the network operational will become more frequent during the pandemic period.

3. RECOVERY

This component consists of activities that help people, families, groups and communities return to normal life after a pandemic. Note that recovery activities will be carried out taking into account that there may be successive waves of pandemic.

THE PHASES ESTABLISHED BY THE WORLD HEALTH ORGANIZATION

The World Health Organization has defined three periods and six phases associated with an influenza pandemic:

1. The interpandemic period includes the first two phases and implies that no new virus has been detected in humans, despite there being outbreaks of avian influenza that are more or less likely to cause human infection;

2. The pandemic alert period is characterized by a new virus being identified in humans. It includes phases three, four and five, which cover the virus’s varying ability to adapt to humans and person-to-person transmission;

3. The pandemic period itself (phase six) may occur in several waves before there is a return to the interpandemic period.
THE LINKS BETWEEN THE PHASES SET OUT BY THE WORLD HEALTH ORGANIZATION AND THE COMPONENTS OF ACTION

The three components are in step with the periods established by the World Health Organization that are currently being applied to monitor the evolution and imminence of the pandemic. The table below shows that response activities have already been initiated although the pandemic phase, phase six, has not yet been declared. These activities centre mainly on public health and communication.

HOW TO READ THE DIVISION OF RESPONSIBILITY TABLES

Except in chapter one, this plan presents specific strategies and actions, and indicates areas of responsibility at the provincial level.

<table>
<thead>
<tr>
<th>Description of activity</th>
<th>Head Contributor</th>
<th>Section</th>
<th>Tools</th>
<th>Comments</th>
</tr>
</thead>
</table>

The first column provides a description of the activities to be executed.

The second column lists the heads (e.g., MSSS, ASSS, etc.) as well as contributors, in italics, who will support them in executing the activity described.

The third column indicates the section(s) affected by this activity (refer to the health mission’s five areas of activity in chapter one).

The last two columns list any reference tools and comments to be taken into consideration.

---

2. This term does not refer to a period defined by WHO. It is used solely in the planning of recovery activities.
CHAPTER 1

BASIC CONCEPTS IN THE FIGHT AGAINST AN INFLUENZA PANDEMIC

Being prepared for an influenza pandemic involves taking action before, during and after each wave. However, all activities must stem from certain basic concepts and conventions. These concepts will provide network members and their partners with a common vision of the strategies to be used.

These concepts have been developed in light of lessons learned from managing crises and disasters, specifically SARS and the ice storm. They are also drawn from best practices from different countries and scientific literature, respecting the response principles of the Organisation de la sécurité civile du Québec. These basic concepts and conventions are the following:

The three principles of response

Four groups of stakeholders

Three rules of governance

The text that follows presents these concepts and conventions.

THE THREE PRINCIPLES OF RESPONSE

FIRST PRINCIPLE: STRATEGIES THAT MATCH THE FUNCTIONS OF THE NETWORK

In the event of an influenza pandemic, the mission of the health and social services network is to save lives and preserve the health and well-being of the people. This mission addresses five areas of activity:

- protect the health of the public (public health);
- provide medical care (physical health);
- ensure people’s psychosocial well-being (psychosocial response);
- provide clear, relevant and mobilizing information (communication);
- keep the network working (continuity of services).

Each of these areas of activity is of equal importance, and the order in which they appear is not indicative of priorities.

SECOND PRINCIPLE: ADOPT A TOP-DOWN DECISION-MAKING PROCESS

During a pandemic, decisions must be made quickly and result in concrete action for people, families, groups and communities. To do this, the Ministère takes a leadership role and coordinates all health-related responses by the health and social services network. The chain of authority in effect during a pandemic goes from top to bottom, commonly called a top-down model.

This simple chain of authority moves from the minister to agencies and from agencies to health and social services providers. The similarity of the management structures at each level makes the chain of command simple, fluid and effective, and all areas of activity can be integrated into a coherent and concerted whole.

The minister’s involvement in the event of an influenza pandemic falls under the legal framework defined by the Public Health Act, which serves as the basis for responsibilities and powers. This law confers particular powers on public health authorities and on the government to allow them to protect public health when it is subject to a clear and present threat.

Furthermore, since an influenza pandemic could result in a high level of absenteeism and generate a certain amount of social disorganization, the Civil Protection Act could also serve as a legal basis for the government to implement a series of measures to contain the consequences of an influenza pandemic.
THIRD PRINCIPLE: DELIVER A HIGHLY EFFECTIVE ORGANIZATION

The ministerial coordination structure

While an influenza pandemic is a major public health problem, its impact on health and social services affects, at one point or another, all of the areas of the health mission as described in the *Québec National Civil Protection Plan*. The management of this problem, both in terms of planning and response, must therefore be done at a high level and head up the entire organizational structure of the *ministère de la Santé et des Services sociaux*.

In a context such as this, the entire internal coordination structure of the Ministère is placed under the authority of the associate deputy minister responsible for coordination, finance and equipment, who reports directly to the actual deputy minister. This coordination structure mobilizes all of the Ministère's departments.
The strategic management unit

Strategically, the associate deputy minister is responsible for the strategic management unit. With the support of the national public health director who assumes his legal responsibilities, the director of communications, the director of operations and the ministerial emergency preparedness coordinator, the associate deputy minister is responsible for major strategic decisions. These decisions are binding.

Operations Branch

The director of operations oversees the application of operational decisions with a team made up of employees from each branch of the Ministère, to cover all areas of activity of the health mission. A new area, emergency preparedness, has been added to ensure that other emergency preparedness partners identified in the health mission are supported.

The director of operations is also in contact with the CEOs of health and social services agencies to give them necessary instructions and collect information from the regions.
Coordination structure of the health and social services network

To provide all levels of the network with a vertical coordination structure that facilitates the circulation of ministerial directives and to allow for fluid two-way circulation of information, the ministère de la Santé et des Services sociaux has asked that agencies and establishments adopt a coordination structure that is similar to its own.

In the agency, the CEO assumes responsibility for the response of the sociosanitary network in his or her region in the event of an influenza pandemic. To accomplish this, he or she presides over a strategic management committee with the help of the public health director (who is a link to the national public health director), the regional emergency preparedness coordinator and, as needed, any other director in the organization whose input is required for a decision. The CEO will appoint a communications resource.

The committee will make regional decisions and use the operational strategies needed to respond to ministerial directions and decisions.

Furthermore, the CEO is in direct contact with the general directors of health and social services facilities in their region, extending the top-down coordination structure. He or she is also in contact with medical authorities like the Direction régionale de médecine générale (DRMG).

At the local level, general directors of health and social services establishments are responsible for the local response to an influenza pandemic, respecting the mission or missions their organization is responsible for. The health and social services centres also have a specific responsibility related to emergency preparedness as organizations that respond to municipal emergency preparedness organizations in their territory. The general director of each establishment in the network is backed by a strategic management committee made up of the directors of the organization, the local emergency preparedness coordinator and a communications resource.
## Preparedness: ministerial coordination

## Specific planning

| Develop a ministerial pandemic influenza plan and keep it up-to-date | MSSS | Coord |
| Develop a basic structure for a regional pandemic influenza plan | ASSS MSSS | Coord |
| Ensure that each ASSS has an RPIP that is consistent with the actions to be taken | MSSS | Coord |
| Ensure that each ASSS is taken into account in the development and updating of the RPIP, patient groups and resources related to IR, FTR, community organizations and social economy enterprises | MSSS | Coord |

## Drill program

| Develop and organize a drill program specific to the MSSS | MSSS | Coord |
| Ensure that there are connections between the drill programs at the provincial and regional levels | MSSS ASSS | Coord |

## Phase changes

| Notify the ASSS CEOs and regional emergency preparedness coordinators each time the WHO declares a phase change | MSSS | Coord |

## Response: ministerial coordination

| Alert and implementation of plans |
| Alert the ASSS CEOs and regional emergency preparedness coordinators once the beginning of phase 6 has been announced by the WHO | MSSS | Coord |
| Initiate response activities at the established thresholds | MSSS | Coord |
| Ensure that the RPIP of each ASSS is implemented | MSSS | Coord |

| Coordination meetings |
| Hold coordination meetings regularly | MSSS | Coord |
| Issue situation reports at the minister’s request | MSSS | Coord |
Coordination with ministerial partners

In normal times, the ministère de la Santé et des Services sociaux and a number of organizations and enterprises work together on a regular basis. In an influenza pandemic situation, there is an even greater need for concerted effort with partners to facilitate the organization of activities within the network’s establishments.

The challenge of making a concerted effort is to get all of these organizations to agree on a Québec-wide initiative that will be put in motion regionally and locally, as well as combined efforts to respond to the needs of the people. Everyone must feel united in terms of expected results, play their role in the spirit of respect for partners and be part of an integrated approach.

Coordination of emergency preparedness

The deployment of the health mission will involve the various mechanisms to emergency preparedness partners identified in the Québec National Civil Protection Plan. The activities headed up by these partners will be subject to consensus and will be conducted at the ministerial, regional or local level, depending on the activity.

On a different matter, an influenza pandemic could be a major disaster, the repercussions of which could extend well beyond the health and social services network due, in particular, to an unparalleled level of absenteeism. This shortage of human resources will affect all of our society’s socio-economic activities. In such a context, all civil protection partners in Québec and a number of government, municipal or private sector authorities will mobilize at different times during an influenza pandemic: preparedness, response or recovery.

Ties with emergency preparedness

There are two levels of ties with emergency preparedness. The deputy minister is a member of the Comité de sécurité civile du Québec (CSCQ), which, under the direction of the government’s Secretary General, provides direction for and approves government emergency preparedness planning. During a pandemic, the Secretary General supervises government activities and reports to the Premier of Québec.

The ministerial emergency preparedness coordinator is a member of the Organisation , which ensures that directions from the CSCQ are implemented. Health decisions that impact other sectors will be dispatched through this main channel.

FOUR GROUPS OF STAKEHOLDERS

The groups of stakeholders refer to all people who could actively contribute to saving lives and to the health and well-being of the public. If well prepared, players will be able to take action at their level, according to their roles, for the benefit of specific patient groups or other stakeholders.

The groups of stakeholders are as follows:

<table>
<thead>
<tr>
<th>Stakeholders</th>
<th>Description</th>
<th>Features of the role</th>

</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Partners</td>
</tr>
</tbody>
</table>

Most of the time, one person plays several roles at once according to, for example, where they live or work. All stakeholders are an integral part of the chain. This chain operates according to a “supplier-customer” logic, the main objective of which is to position the citizen as the ultimate client. This means that a stakeholder can dispense care and services to another or become a user of care and services, depending on the circumstances.
THREE RULES OF GOVERNANCE

Three rules of governance should guide the conduct of all stakeholders who assume one or more roles during an influenza pandemic. These rules are interdependent and have the common condition that everyone be vigilant as to their own state and the state of others and act accordingly. These rules are in accordance with the emergency preparedness philosophy advocated by the Government of Québec, within the framework of the Civil Protection Act, among others.

Protection

Our first concern is protection: faced with a risk, real or perceived, current or potential, stakeholders must protect themselves and encourage others to do the same.

Solidarity

The second concern is solidarity: in an emergency situation, stakeholders must assist others, ask for help if the situation requires it and encourage others to help, for the purposes of the common good.

Responsibility and sound management

The third concern is that of responsibility: in the event of an emergency, stakeholders continue in their essential activities or try to find a replacement solution, seek out information on the status of the situation as it relates to them, and follow instructions and notices that concern them.

Finally, it is important to remember the importance of responsible administration. The implementation of action plans to deal with an influenza pandemic will involve major costs, particularly for preparation and response.
CHAPTER 2

STRATEGIES

The purpose of the strategies

As mentioned previously, the agencies and establishments will each prepare a plan that presents their preparations for countering the pandemic, each at their level of responsibility. The Québec Pandemic Influenza Plan?Health Mission will be used as a guide in preparing these plans.

These plans contain specific information: a list of activities to be deployed, the individuals responsible and the contributors for each area of activity, the sequence for plan implementation, the impact of the pandemic on human resources, etc.

Moreover, each of these plans will improve, at its respective level, the existing emergency measures plans by integrating specific information on infectious diseases in general and the influenza pandemic in particular.

Strategies for dealing with the five areas of activity addressed by the network’s mission

In the event of an influenza pandemic, the mission of the health and social services network is to save lives and preserve the health and well-being of the people. This mission addresses five areas of activity:

• protecting the health of the population (public health);
• providing medical care (physical health);
• ensuring people’s psychosocial well-being (psychosocial response);
• providing clear, relevant and mobilizing information (communication);
• keeping the network working (continuity of services).

SECTION ONE: PROTECTING THE HEALTH OF THE POPULATION (PUBLIC HEALTH)

During an influenza pandemic, the mission of the health and social services network is to protect the Québec population. This involves delaying the outbreak of such a pandemic in Québec and, when it occurs, minimizing its impact. Five strategies will contribute to this objective:

Strategy No. 1: Conduct epidemiological monitoring and surveillance
Strategy No. 2: Apply measures to prevent and control infections
Strategy No. 3: Use antivirals for preventive purposes
Strategy No. 4: Vaccinate the population
Strategy No. 5: Implement public health measures

STRATEGY NO. 1: CONDUCT EPIDEMIOLOGICAL MONITORING AND SURVEILLANCE

Surveillance is the ongoing and integrated process of gathering, analyzing and disseminating virological and epidemiological data that serve to guide actions and evaluate their impact.

Over the last 10 years, there has been a monitoring system in Québec for tracking influenza activity on an ongoing basis, regardless of the pandemic phase. Surveillance is based on five main areas: 1) virological monitoring (laboratory); 2) the monitoring of outbreaks; 3) the surveillance of influenza-like illnesses (ILI); 4) the surveillance of severe respiratory illnesses (SRI); and lastly, 5) epidemiological and scientific monitoring. The activities for each of these components are timed according to the epidemiological situation and the pandemic threat level.
Other surveillance data gathered by parallel systems make it possible to monitor vaccination coverage and adverse reactions related to vaccination. Similarly, new indicators required to track and assess the situation must be developed and integrated into the surveillance system (for example, the monitoring of the antiviral strategy and the adverse reactions related to antivirals).

When an influenza pandemic becomes imminent, there will be an increased and urgent need for surveillance data, and the number of clients (individuals and organizations) interested in obtaining and using this data will grow. In preparing for a pandemic, it is therefore desirable, even necessary, that the current surveillance system be optimized and that the data from other existing systems be integrated.

Surveillance activities during an influenza pandemic will include the monitoring of the antiviral strategy and vaccination coverage, the surveillance of adverse reactions subsequent to vaccination and the administration of antivirals, as well as the monitoring of public health measures. The actions to be implemented for these indicators are outlined in the sections of this chapter.

**Surveillance based on the three pandemic periods**

During a pandemic alert, surveillance is used for the early detection of conditions that may lead to a pandemic outbreak. It also serves in the early detection and characterization of the first cases caused by the new pandemic virus.

In the pandemic period, the purpose of surveillance is to guide and adjust all responses to the pandemic and assess their impact. As such, surveillance is used to identify the phases of the pandemic (beginning and end of the wave), and to identify and characterize the affected populations, thereby making it easier to identify the groups at risk, namely for the antiviral strategy (prevention and treatment) and vaccination. Lastly, it will be used to detect the most affected aggregates and geographic areas.

During the recovery period, the goals of surveillance are to evaluate the impact of the pandemic, assess the effectiveness of preventive measures and evaluate the surveillance system.

Finally, surveillance data will be used to inform target populations (decision makers, health workers, general population, the media) of the epidemiological situation and its evolution, regardless of the phase in progress.

STRATEGY NO. 2: APPLY MEASURES TO PREVENT AND CONTROL INFECTIONS

Prevent the spread of the infection

Successfully fighting an influenza pandemic will depend on compliance with measures for preventing and controlling infection transmission between people.

Measures of this kind will be particularly important in healthcare environments. They include the basic practices usually applied to all patients, regardless of their diagnosis, as well as additional precautions established to prevent transmission through droplets and contact.

The cornerstone of preventing infections is handwashing. To limit the spread of influenza, a person should avoid touching their eyes, nose or mouth with their hands. Ideally, a person should cough into a disposable tissue and then wash their hands. When this is not possible, cover your mouth with the inner part of your upper arm, not with your forearm.

Regional councils for the prevention of nosocomial infections, as well as microbiologists and committees for the prevention of infections in establishments, are crucial partners in the implementation of this initiative in the field.

Tailoring guidelines to the reality of the pandemic

Provincial guidelines governing the application of measures to prevent and control infections contracted during hospitalization (nosocomial infections) have already been established. Guidelines adapted specifically to a pandemic situation will be enacted. Healthcare facilities will be required to integrate these recommendations into the infection control measures already in place.

Implementing measures outside establishments

Another step will be to promote the application of infection prevention and control measures outside establishments in medical clinics, pharmacies, the workplace, daycare facilities, schools, various communities and community resources, among others.

Actions timed according to the periods of the influenza pandemic

In the interpandemic period, basic practices and additional precautions will need to be applied more stringently, particularly in waiting rooms.

During the pandemic alert period, in the event of a suspected case of severe respiratory illness, additional precautions must be applied to prevent airborne transmission.

In the pandemic period, basic practices must always be applied along with additional precautions that apply depending on the epidemiology and mode of transmission identified for the pandemic strain in question. These recommendations will come from the Comité sur les infections nosocomiales du Québec (CINQ).

STRATEGY NO. 3: USE ANTIVIRALS FOR PREVENTIVE PURPOSES

**In the absence of a vaccine ...**

Regular handwashing and other hygiene measures are effective means of prevention and are essential to fighting a series of infectious agents. In the absence of a vaccine, antivirals are the only specific means available for countering a pandemic virus. There are now antivirals that, under certain conditions, can be used to prevent or treat influenza.

During the alert period and at the beginning of a pandemic, the use of antivirals could help slow the spread of isolated cases, reduce the risk of genetic exchanges between human and avian viruses, and possibly delay the onset or worsening of a pandemic.

In a pandemic situation, particularly before a vaccine is available, the judicious use of antiviral drugs could help reduce morbidity and reduce absenteeism, thereby helping maintain services. Antivirals cannot, however, contain the virus’s transmission and circulation in the community.

**The limits of antivirals**

There are several limits to the use of antivirals. We have little documentation on their effects in a pandemic situation. It is possible that resistance will develop and that there will be unexpected side effects, even using antivirals that are the least likely to produce these effects. Another obstacle is the limited availability of the most promising antivirals, such as neuraminidase inhibitors.

**Priority groups first**

There is a list of priority groups recommended by the Public Health Agency of Canada and submitted to public health authorities to help plan for a pandemic. These priority groups are reviewed Canada-wide in light of new knowledge and the evaluation of the situation by public health authorities around the world.

The list of priority groups for administering prophylactic antiviral agents will change by virtue of recommendations from international, Canadian and Québec experts, and according to the epidemiological data gathered during the phases of the pandemic. At the same time, we will have to monitor side effects and the development of resistance in people who take the antivirals during the pandemic.

The majority of tools in the tables that follow are from *La mise sur pied d’un point de distribution d’antiviraux en prophylaxie* (marked as “Antiviral POD” in the Tools column).

STRATEGY NO. 4: VACCINATE THE POPULATION

The most effective means

Vaccination remains the most effective means of preventing the morbidity and mortality associated with influenza. According to current knowledge, vaccination prevents the disease in at least two thirds of healthy people. In seniors and those with a chronic disease, it can significantly reduce the risk of complications, hospitalization and death. Against this backdrop, the importance of a vaccine being available during a pandemic quickly becomes apparent.

Although it is the basis of the response to a pandemic in Canada and in many other countries, and while it is an essential component in this fight, vaccination cannot prevent a pandemic because a vaccine for the pandemic strain will not be available at the onset of the pandemic.

Also, its effectiveness cannot be determined beforehand, given the unknowns about the strain and the vaccine that will eventually be developed. Nevertheless, vaccination remains the most important tool in mitigating the impact of an influenza pandemic.
**Vaccinate the priority groups while awaiting vaccines for everyone**

When vaccine production begins, the number of doses available will be insufficient to cover the entire population. Therefore, people in the priority groups will be the first to have access to vaccination: healthcare workers, workers in essential services, vulnerable people, all according to the established order of priority. Secure inventory management will be required during the shortage period.

**Vaccines for everyone**

In the months following the identification of a pandemic viral strain, the entire population will be offered the vaccine against influenza, possibly as a two-step vaccination. Although we do not know exactly when the vaccine will be available, we must get ready as of now to offer the vaccine to the entire population. In Québec, between 11 and 14 million doses of vaccine (75% to 90% of the population) are expected to be administered. Such an operation represents an organizational challenge that goes beyond any mass vaccination efforts ever conducted in Québec.

**Mass vaccination centres**

The model for delivering the vaccine during a pandemic will differ from the usual model for vaccinating against the flu, where 50% of the vaccines are administered by physicians in their private practices.

During an influenza pandemic, vaccination will be provided at mass vaccination centres under the responsibility of health and social services centres. In these centres, the service model divides the activities that will take place in sequence. The model involves a minimal number of nurses, since several tasks usually performed by nurses will be handled by other resources trained to do so: volunteers, clerks, secretaries, first-aid workers, etc. This model also allows nurses and physicians to devote themselves to caring for the sick. Mass vaccination clinics will be able to vaccinate up to 320 people per hour, or 2,500 people in eight hours.

To understand the scope of the influenza pandemic’s impact on the health and social services network, see section five Keep the network working.

**Actions timed according to the periods of the influenza pandemic**

In the interpandemic period, a rise in the rate of vaccination against the seasonal flu will allow companies that produce the vaccine to develop their infrastructures and increase production capacities, enabling the population to be vaccinated.

Increasing the vaccination rate against pneumococcus in groups at risk will help reduce the incidence and severity of one of the complications of influenza, pneumococcal pneumonia.

During the pandemic period, small-scale vaccination will take place based on priority groups. Mass vaccination can then begin, the duration of which is estimated at four to six months (depending on available doses), reflecting the need to receive two doses of the vaccine to acquire adequate immunity.

The tools listed in the tables and other tools are in the Guide pour la réalisation d’une vaccination de masse (referred to as Vaccination guide in the Tools column of the following tables).

STRATEGY NO. 5: IMPLEMENT PUBLIC HEALTH MEASURES

The public health strategies used may vary according to the phases of the pandemic, its epidemiology, and the feasibility of response actions that take into account the availability of human and material resources. If necessary, the recommendations that are put forward can be modified to reflect specific situations, such as the threat of a pandemic or a declared pandemic.

Unlike other response strategies, the effectiveness of public health measures implemented in the field to limit the spread of infection or its impacts has not been well documented using evaluation methods in a pandemic situation. This can be explained by the rare occurrence of pandemics.

The recommendations put forward are based on assumptions about what we know about influenza in terms of modes of transmission, the incubation period and the contagion period. They would need to be reviewed if the characteristics of the pandemic virus differ significantly from the known characteristics of influenza. These recommendations reflect the best possible current analysis and are the result of a consensus.

Finally, particularly with respect to case and contact management, a proactive and sustained public health response is highly appropriate during the pandemic alert period and possibly at the very onset of the pandemic. It is only when there is a limited number of cases that an intensive, individual response to cases and contacts would be feasible and likely to have an effect, such as slowing the virus’s spread and delaying it from spreading more widely throughout the community.

Health education

During the interpandemic period, public education will focus on general information about influenza, vaccination, health measures for preventing infections and the characteristics of influenza outbreak seasons. However, this period and the alert period are also opportune times to introduce concepts that will be needed during a pandemic, including the definition of a pandemic, preventive measures in the event of a vaccine and antiviral shortage, health measures for limiting transmission, respiratory etiquette and self-care.

Controls at the community level

Given that the pandemic virus will probably behave similarly to other types of influenza A viruses, controlling the dispersion of influenza in the community will be extremely difficult.

The virus’s short incubation period, the high rate of infection, the virus’s ability to survive on surfaces for long periods of time, the non-specific symptoms as well as the potential for asymptomatic infection and transmission by asymptomatic individuals significantly limit the effectiveness and feasibility of most public health control measures.
Since a pandemic virus’s potentially high attack rate in the population will put considerable pressure on the health network’s resources, the ideal course of action would be to devote resources to those measures that are known to be most effective in controlling influenza.

**Limiting public gatherings**

Generally speaking, public gatherings and promiscuity are known to promote the spread of infection. At the start of the pandemic, therefore, restricting certain public gatherings may delay the pandemic’s onset and provide some relief before a vaccine becomes available.

**Special measures for travellers**

Based on WHO recommendations, the Public Health Agency of Canada will make recommendations on border control measures. Federal authorities are responsible for updating these measures. However, provincial authorities and authorities in areas adjacent to the United States will be called upon to assist in their application. The measures will vary depending on the location of the first cases.

Case and contact management

Case management

Measures that apply to case management should be planned during the interpandemic period and the pandemic alert period (when human cases may develop), and deployed as soon as suspected or confirmed human cases arise in Québec.

Case management should be adapted to the situation as it evolves. The use of a personalized approach will not be sustainable once the pandemic virus begins moving through the population. The following recommendations are in regard to the general management of influenza cases caused by the pandemic virus.

The measures to be implemented during the alert period are adjusted according to where the alarm is raised. However, if cases start being reported in Canada or Québec, or if the alarm is raised in Canada or Québec, the steps taken will mainly involve mobilization and the deployment of recommended measures.

During the pandemic period (with a confirmed pandemic), case management will proceed according to indicators other than individual disclosure, and the necessary information will be provided through messages to the general public rather than on an individual basis. Among the messages that should be prepared in advance are those regarding home quarantine, self-care, information on medical consultation or assessment and the sites designated for this purpose. The duration of the quarantine will be adjusted according to the knowledge that has been gathered about the pandemic virus.

Contact management

Contact follow-up should be intensified during the alert period and, if possible, at the onset of the pandemic while it can still be done (with sufficient resources being available) and a certain control over the virus’s spread is possible, that is, while the pandemic virus is not yet circulating in the community.

The importance placed on this measure should decrease as the pandemic evolves and the spread of the virus can no longer be contained on an individual basis. At this point, messages will be conveyed through public education campaigns, as health network resources will be redirected to other activities. To date, it has not been recognized that quarantining contacts is an effective measure for preventing the spread of influenza once the outbreak is entrenched.

The individual management of contacts is potentially feasible at the onset of the pandemic, but would involve switching rapidly to a strategy that can be applied to the entire population. Antiviral availability will dictate the feasibility of instituting a post-exposure prophylactic measure for contacts. Public health resources must ensure that antivirals are administered to targeted individuals.

SECTION TWO: PROVIDE MEDICAL CARE (PHYSICAL HEALTH)

During an influenza pandemic, the health and social services network will face a major wave of consultations at all levels of service, some of which are more likely than others to become overloaded. This situation could result in a shortage of services, in particular:

- massive numbers of visits by a million patients to family doctors and front-line care sites;
- emergency room visits by a large number of patients whose condition will require a second line of consultation;
- hospital beds for those who need them, approximately 34,000 people;
- access to critical care for those with severe complications.

The network and physicians will have to counter the development of complications from the infection, treat the complications and, for seriously ill patients, reduce morbidity and save as many lives as possible.

In terms of physical health, the Ministère has set out eight strategies:

Strategy No. 6: Act upstream of establishments through self-care
Strategy No. 7: Adapt home support services
Strategy No. 8: Ensure access to Info-santé and Info-social
Strategy No. 9: Set up prehospital emergency services
Strategy No. 10: Coordinate the delivery of healthcare
Strategy No. 11: Deploy non-traditional healthcare sites
Strategy No. 12: Treat patients using antivirals
Strategy No. 13: Dispose of remains effectively

Treating people (physical health) involves activities throughout the chain of care, according to a massive morbidity approach. These activities will be intense during the pandemic period and closely tied to other parts of the plan.
STRATEGY NO. 6: ACT UPSTREAM OF ESTABLISHMENTS THROUGH SELF-CARE

Given that the health and social services network will have to perform intensive screening and limit as much as possible the presence of patients who are not seriously ill in healthcare establishments, the public will be encouraged to stay at home.

A self-care guide

A self-care guide will be distributed at the appropriate time. The document will suggest ways to prevent the spread of influenza, alleviate symptoms, and provide information on when to stay at home and when to go to a healthcare provider. Public communications and a telephone answering service will also help the population find the information it needs.

Home: the first site of care

The general strategy will call on the ability of people to care for themselves with the help of family, friends, local groups and community resources, without forgetting the support of the health and social services network and its partners. In this context, the first site of care will be the home, which will help reduce the spread of the illness as well as the pressure on the system.

This strategy is only realistic if the people who stay at home are adequately served. These people’s vulnerability must be taken into account, and they must be monitored closely, especially those who live alone. Home support services and Info-social and Info-santé will play a key role in this effort.

</table>
STRATEGY NO. 7: ADAPT HOME SUPPORT SERVICES

The network must make sure to support informal caregivers in order to promote home support services. People who are identified as being vulnerable, either due to their physical condition or their degree of isolation (those who do not receive any assistance from friends, family or an informal caregiver), will be able to register for a home support service that will check on the state of their health and prioritize their admission, if required.

Home support services will be for target patient groups whose symptoms correspond to pandemic influenza and who will remain at home. The health status of these individuals will be stable and not require hospitalization. In certain cases, the situation will involve a family member or an informal caregiver remaining with the patient, to ensure follow-up in the event the patient’s health deteriorates.

The concept of regular home support services refers to services for users who regularly receive homecare services from CSSS. These services can be offered by CSSS personnel, social economy enterprises, community organizations and private contract workers.
In the event of an influenza pandemic, regular home support services will not be able to meet demand. It will therefore be necessary to structure a response where all partners, non-profit organizations, community organizations, social economy enterprises and volunteers will be called upon to contribute. Home support services will be able to rely on these various partners.

The network must remain ready to take charge of patients at home if their situation worsens, by directing them to appropriate services and providing for adequate transportation, if necessary. The public will be given information on ways to access these services, including easy telephone access.

**STRATEGY NO. 8: ENSURE ACCESS TO INFO-SANTÉ AND INFO-SOCIAL**

For people who are infected, sick and staying at home, particularly those who live alone, fast, easy access to Info-santé and Info-social or to an influenza pandemic information service is essential.

Info-santé and Info-social are certain to play a major role during the pandemic, but like the network’s other services, they could quickly become overwhelmed and affected by a high rate of absenteeism among their personnel.

There are two possible solutions:

1. The first is to substantially increase the service’s resources during a pandemic.
2. The second is to use another telephone service that can act as an initial filter for questions from the public to direct callers to the appropriate resources.

Given the potential number of calls and the need to keep network activities running, it is imperative that calls be properly distributed, regardless of the phone system used.

Note that eight regions in Québec have Info-social service. For regions that do not have this service, a psychosocial worker should be integrated into the Info-santé team.

STRATEGY NO. 9: SET UP PREHOSPITAL EMERGENCY SERVICES

The various components of the prehospital service chain, including dispatch centres, first responders and ambulance services, will play a crucial role during a pandemic. Naturally, these sectors will also be under pressure due to personnel shortages.

Calls from the public will be handled as part of regular dispatch centre and regional call centre operations. However, the scale of the pandemic could justify special procedures, such as the setting up of a provincial centre to regulate inter-establishment transfers, in order to validate and authorize transfers from the health and social services network.

In terms of protection measures, as for all of the network’s resources, steps have been taken to ensure that prehospital services personnel have sufficient protection equipment for the duration of the influenza pandemic.

Overall, the demand for prehospital services will increase considerably during a pandemic. Prehospital service workers must be ready, with their partners, to rapidly identify cases:

- those requiring an immediate response;
- those who can be asked to stay at home;
- those who will have to be directed to other resources or sites deemed more appropriate, depending on the recommendations in effect.

STRATEGY NO. 10: COORDINATE THE DELIVERY OF HEALTHCARE

Keeping the health and social services network operating during an influenza pandemic requires strict management of services and priorities. People whose health situation requires it will be served first, according to the material and human resources of healthcare establishments and partners like medical clinics.

Four levels of access to healthcare and services will require specific actions to adapt regular operations to a pandemic and to maintain emergency operations that are both related and unrelated to the pandemic. The challenge will be to encourage the stakeholders involved to alter their services and to integrate streams for patient groups who show symptoms of influenza, while trying to limit the spread of the infection.
Front-line services
All possible actions will be taken to act upstream of the network. To do this, all network and non-network front-line partners must help. Within the LHN created by Bill 25, medical clinics, including family medicine groups and network clinics, will experience a lot of demand, as will other sites for assessment and delivery of healthcare. Working with physicians in the area and other front-line resources, it is important to plan for dedicated healthcare streams, including sites for triage and assessment and the mobilization of workers, if necessary.

Emergency units and services
As soon as people become infected, measures will be put in place to stress measures for protection and prevention. Triage adapted to the situation will make it possible to identify patients with flu symptoms as soon as they arrive and to orient them so as to avoid hospital-acquired contamination. As well, an overflow plan will be applied as soon as the situation becomes more difficult in terms of traffic and congestion.

Hospital activity
Hospitals may have to rationalize their services and suspend or postpone certain activities. An internal emergency measures plan regarding infections will be integrated into existing emergency measures plans. In this context, coding specific to the pandemic, based on available resources and the level of demand for care, will make it possible to monitor how stretched the healthcare establishment is and to take appropriate measures set out in the plan.

Critical care
It is important that every effort be made so that those who are the most sick have access to care, whether or not their condition is related to the flu. The healthcare establishment’s plan will identify the measures to be taken to increase the number of intensive care beds and human resources as needed. Additional and replacement equipment, such as respirators, will be available.

It is important to make front-line, second-line and third-line emergency activities secure so that there is no break in the chain of care between the different levels of traditional and non-traditional services. Specific healthcare guides and protocols will be applied to ensure that the healthcare provided is uniform.

Mechanisms will be planned to facilitate access to experts for front-line and second-line responders and to assign resources according to priorities and the situation at healthcare sites.

**Note:** The table provides a structured overview of actions and tasks related to the recovery phase of delivering healthcare during a pandemic. Each action is listed with details on the head contributor, section, tools, and any relevant comments or notes. This structured approach helps in tracking and implementing the necessary strategies and measures to ensure effective healthcare delivery during and after a pandemic event.
STRATEGY NO. 11: TREAT PATIENTS USING ANTIVIRALS

As mentioned previously, antiviral drugs are recommended for the prevention and treatment of influenza. During a pandemic alert, they can be used to prevent or delay the development or spread of the virus. In a pandemic situation, especially when there is no vaccine, antivirals can reduce morbidity and mortality, and help maintain services.

In light of a possible shortage of antivirals and the opinion of experts, the Ministère will prioritize the administration of antivirals according to a person’s vulnerability and the pandemic’s severity. This prioritization will be revised in relation to the pandemic, its attack rate, the virulence of the viral strain, and the actual or expected clinical response to the antivirals provided.

In order to make optimal use of antivirals, physicians who prescribe them must not only follow the clinical indications and the recommended dosage, but also the administration priorities established by the Ministère. Within this context, plans must be made for secure distribution mechanisms and sites, precise monitoring of their use, tracking of the inventory and the appearance of resistance or adverse reactions.

STRATEGY NO. 12: DEPLOY NON-TRADITIONAL HEALTHCARE SITES

During an influenza pandemic, maintaining regular health network activities requires opening up non-traditional healthcare sites to take care of those whose health does not allow them to rely on home support services. These sites will carry out triage and assessment, provide treatment, and direct and admit those who have the flu and meet certain criteria.

“Non-traditional healthcare site” means a “site that is not currently recognized for short-term healthcare.” It could be within a healthcare institution, respecting certain criteria. Non-traditional sites will be associated with an institution, as determined by the Ministère. This association will make it easier to manage these sites and their human, equipment and financial resources.

An evaluation of the equipment required will make it possible to ensure that essential, critical equipment is available. The decision to identify non-traditional healthcare sites, their location, their number and whether to use them will be the responsibility of health and social services agencies and will be ratified by the Ministère.

STRATEGY NO. 13: DISPOSE OF REMAINS EFFECTIVELY

An influenza pandemic could result in a significant number of deaths over a relatively short period of time. Under normal circumstances, the network’s establishments have sufficient infrastructures to wait for funerary services to take charge of the remains.

During a pandemic, we must accelerate certain administrative procedures, including the pronouncement of death. Taking into account the links established with the business associations in the funerary sector, the agencies must make sure that funeral homes are ready for a pandemic. The agencies must also make sure that funeral homes are well aware of the locations for taking charge of the remains.

3. Community resources include community organizations, intermediate resources, family-type resources and social economy enterprises.
SECTION THREE: ENSURE PEOPLE’S PSYCHOSOCIAL WELL-BEING (PSYCHOSOCIAL RESPONSE)

An influenza pandemic will affect people’s physical integrity; their psychosocial dimension will also be considerably affected. Psychosocial impacts will be felt not only by those who are ill, but also by those close to them, such as friends and family, and throughout society.

The health and social services network, together with community resources, will strive to ensure the well-being of Québec’s population by preparing it to fight the influenza pandemic, supporting the public as the infection spreads, and facilitating the return to normal life. In addition to the specific services available during a pandemic, psychosocial services will be provided by various network establishments that will be adapted. These services will be reflected in local and regional plans.

To this end, there are four strategies:

- Strategy No. 14: Coordinate psychosocial services
- Strategy No. 15: Identify patient groups
- Strategy No. 16: Provide services tailored to the situation
- Strategy No. 17: Provide the population and partners with advice

STRATEGY NO. 14: COORDINATE PSYCHOSOCIAL SERVICES

Efforts to coordinate activities will be of the utmost importance in ensuring a successful psychosocial response. The Ministère will direct the efforts in the various regions with a view to achieving a common goal: minimizing the psychosocial impacts during a pandemic and limiting the damage to the population’s well-being during the recovery stage. Promoting cooperation among stakeholders is paramount to building social solidarity. The principal actions and mechanisms related to coordination cover the following aspects:

- alerting, mobilizing and demobilizing human resources
- updating the psychosocial aspects of the emergency preparedness plan in the context of an influenza pandemic
- ensuring the consistency of the psychosocial aspect at the provincial level
- establishing ties with network partners
- planning the organization process at the time of the event
- preparing mechanisms for liaising, communicating and informing
- monitoring and evaluation of operations
- assuming responsibility for ensuring the availability of a skeleton staff (alternates)
- developing a training and drill program

STRATEGY NO. 15: IDENTIFY PATIENT GROUPS

Identifying patient groups in terms of psychosocial factors is an ongoing process of data collection, the goal of which is to identify and understand the psychosocial impact of the pandemic in order to guide actions. This exercise will provide answers to the following questions: Who is affected by the pandemic? How is the pandemic experienced from a psychosocial perspective at the local, regional and provincial levels? Psychosocial identification will also be used to establish mechanisms for referrals and access to service. This identification also allows us to be proactive. The speed with which the services are offered has an impact on the prevention of psychosocial damage and the severity of the effects.

Anxiety of the public

The influenza pandemic will have a major impact on the well-being of the Québec population. Individuals, families, groups and communities may be affected in several ways, particularly psychologically, socially and in terms of the family, as well as in terms of basic, economic and organizational needs. An influenza pandemic will probably increase the level of anxiety among the public, increase cases of depression and exhaustion, and generate nervous problems and problems related to post-traumatic stress.

The most vulnerable people

Strict attention must be paid to certain groups of vulnerable people, including, in particular, elderly people, young people with difficulties and their families or those with pervasive developmental disorders, people who are functionally dependent, people with physical or intellectual disabilities, and people with mental health problems or addictions.

Vulnerability has three dimensions: weakness, disadvantage and exposure to the various effects of such a phenomenon.

Weakness refers to an existing sensitivity in certain people, which affects their emotional stability and their resistance to upheaval. Stressful events create a stronger emotional reaction among these people, and transitory or lasting disorganization.

Disadvantage refers to the fact that certain people are at a disadvantage compared to others in the event of an influenza pandemic due to insufficient financial and material resources, or an insufficient social network, both within their family and their community.

Finally, exposure refers to the seriousness and intensity of psychosocial impacts related to the influenza pandemic. These people are more vulnerable than others in terms of their well-being. This is particularly the case for health and social services workers and those who take care of family members.
Identifying affected people in the network and among the public

Identifying people affected involves the following tasks:

- detecting the impact and psychosocial comorbidities in order to respond as quickly as possible;
- detecting unusual events that could contribute to an increase in psychosocial effects;
- follow the progression of the level of stress among the public;
- follow the progression and the appearance of psychosocial phenomena;
- understand and evaluate the impact of psychosocial comorbidity on the demand for services and on resource needs;
- identify the resources required to respond adequately to psychosocial needs.

</tbody>
</table>
STRATEGY NO. 16: PROVIDE SERVICES TAILORED TO THE SITUATION

People affected by the pandemic will be initially deemed to be people who have the necessary resources to deal with the disruptions inherent to such an event. With this in mind, psychosocial services will support people in seeking solutions and various communities in taking care of their members.

The strategy focuses on people’s autonomy and the solidarity among communities in the belief that initiative, cooperative self-help and mutual support will contribute to mitigating the pandemic’s impact. Therefore, various self-assessment and self-help tools will be made available to the population.

Nevertheless, front-line CSSS psychosocial services will be used and there will be a need for a rapid psychosocial response that is adapted to the population. Specialized services will also be needed and should be used.

In terms of the means to be used, psychosocial workers will adopt a variety of approaches:

- *regular interventions*, such as crisis, individual, family and group interventions, support, respite measures, etc.
- *interventions specific to the pandemic*, such as participation in information sessions, verbalization or the supporting of activities promoting social solidarity, etc.
- *remote interventions* such as Info-santé / Info-social, Internet forums, etc.
- *self-assessment and self-help*, with tools that are easy to understand and use
These approaches will be used with a view to:

- protecting the well-being of people;
- ensuring a response to priority psychosocial needs;
- ensuring that vulnerable people are reached;
- helping people understand their situation and their reactions;
- orienting people in worrisome situations to the appropriate resources;
- preventing psychological, family and social impacts;
- strengthening positive behaviours.

</tbody>
</table>
Clinical supervision

Clinical supervision is another important aspect of the psychosocial response. It adds to the quality of the actions undertaken and ensures that workers receive regular support in stressful response situations. Within the context of an influenza pandemic, clinical supervision will pay particular attention to the phenomenon of compassion fatigue or stress, the perception of personal performance, the feeling of competence and the means of providing services.

To support the ASSS and the CSSS in conducting clinical supervision during a pandemic, the MSSS will prepare related guidelines.
The people who perform clinical supervision will be recognized for their area of expertise in emergency psychosocial responses and they will:

- guide workers in identifying and evaluating psychosocial needs in the community;
- ensure the relevance and quality of interventions;
- provide a protection factor for the psychosocial workers involved.

STRATEGY NO. 17: PROVIDE THE POPULATION AND PARTNERS WITH ADVICE

The psychosocial advisory function is part of managing a situation such as a pandemic. The goal of this function is to inform partners and the public about the important psychosocial factors related to a pandemic and to encourage social mobilization and solidarity among citizens.

More succinctly, the advisory function consists of:

- informing partners about the psychosocial impact of the pandemic;
- informing partners and raising their awareness of the psychosocial impact of their decisions and actions;
- informing the public about the methods of assessing their own health and that of those around them;
- informing the public about methods of self-help;
- encouraging and stimulating social mobilization and solidarity among citizens.
Finally, while it is important to prepare the public for an influenza pandemic, it is also important to be present once the event is behind us. Aside from specific post-pandemic services, psychosocial services will inform the public about the possible impact on their well-being, likely reactions of people postpandemic, and the difficulties of getting back to normal daily life, among others.

SECTION FOUR: PROVIDE CLEAR, PERTINENT AND MOBILIZING INFORMATION (COMMUNICATION)

Due to its particular expertise, the Ministère is responsible for the consistency, relevance and reliability of the information disseminated on health issues. Together with the Executive Council and Sécurité civile, it coordinates and manages health-related communications. The communications function is underpinned by four strategies:

- Strategy No. 18: Ensure health and social services network resources and partners are well informed;
- Strategy No. 19: Inform the population and raise awareness;
- Strategy No. 20: Mobilize the networks;
- Strategy No. 21: Create communication infrastructures dedicated to the fight against the influenza pandemic;

STRATEGY NO. 18: ENSURE HEALTH AND SOCIAL SERVICES NETWORK RESOURCES AND PARTNERS ARE WELL INFORMED

A lack of information inevitably leads to rumours, interpretation and misinformation. As such, it will be important to ensure that network workers share the same vision, have information that is relevant to their contribution and develop the confidence to deal with the influenza pandemic.

Developing this trust is essential so that network workers can contribute to the continuity of activities and act as information relayers in the health and social services network.

The concept of information relayers in this process is fundamental and has several advantages. This strategy will help effectively reach tens of thousands of people in the network, disseminate a coherent message, involve managers and their teams throughout the entire process, obtain rapid feedback, and adjust to local communication realities.
The key duties of information relayers will be to:

- Act as “facilitators” in the flow of information, with the main responsibility of information dissemination remaining that of the designated managers or authorities;
- Have privileged access to organizations’ internal information sources;
- Disseminate information in their workplace;
- Collect the comments received by colleagues to ensure that as few questions as possible remain unanswered;
- Forward these comments to the immediate supervisor or the designated authority so that an action or response can be undertaken, depending on the nature of the information.

The role of the health and social services agencies will be to disseminate to the establishments the direction provided by the Ministère on the communication strategy targeting network personnel, physicians and partners. They will support the establishments in carrying out communication activities directed at personnel.

Establishments will conduct communication initiatives among employees, physicians, sector partners, professional committees and users. They will work on awareness and information activities, and support managers in their role as information relayers.

Moreover, the establishments will form a tactical group consisting of experts, directors and managers that will become the central point in the dissemination of information as well as the reference centre for all stakeholders. In order to ensure the relevance and consistency of the messages, establishments will inform their respective agencies of the communication activities being prepared.

STRATEGY NO. 19: INFORM THE POPULATION AND RAISE AWARENESS

Information and awareness activities will provide the population with facts and basic information on the progress of preparations, the reasons for preparing for the pandemic and how to do so. The preparation phase is crucial: the population will cooperate more readily during a pandemic if it has been adequately prepared to deal with such an eventuality.

We must act now to ensure that the public develops the reflexes it needs to absorb—without panicking—the information that medical and civil authorities will provide when the pandemic strikes.
There are a number of messages about the pandemic currently making the rounds, conveyed mostly by the media and over the Internet. Some of them are correct, while other are sensationalistic. To make sure the population gets accurate and relevant information, reliable channels of communication must be developed as of now. The tools currently available, such as Info Influenza Pandemic and the Influenza section on the Ministère's Web site, must be integrated into a series of activities (media relations, current affairs shows, conferences, etc.) and communication tools (guides with advice for the general public, instruction manuals, etc.) that will be the focus of an action plan covering the three phases: preparedness, response and recovery.

The communications action plan will position network personnel as prime disseminators of information. The network’s thousands of workers and partners will be a dynamic communications force and contribute to building the population’s sense of security through their messages and outlook. Health and social services network resources are in constant contact with the population, and their opinions are worth their weight in gold.

Thanks to the information and knowledge acquired during the ice storm, elected municipal officials and deputies are also equipped to disseminate information to the population, namely in conjunction with the Organisation de la sécurité civile and the ministère des Affaires municipales et des Régions.

**STRATEGY NO. 20: MOBILIZE THE NETWORKS**

Mobilizing the networks will also be essential. This will occur on three levels:

- the mobilization of network authorities, including the network’s health and social services agencies, establishments and personnel;
- the mobilization of other government departments and networks (local elected representatives, for example) that will need to address their own client groups;
- the mobilization of major medical and employer associations, labour unions, members of professional orders, community resources and other groups in society.

STRATEGY NO. 21: CREATE COMMUNICATION INFRASTRUCTURES DEDICATED TO THE FIGHT AGAINST THE INFLUENZA PANDEMIC

Two infrastructures created specifically for the fight against the pandemic will be put in place to meet communication needs:

- A Strategic Communications Coordination Unit
- A Communication Operations Centre

Strategic Communications Coordination Unit

A hub for communications strategy and analysis, the Strategic Communications Coordination Unit will handle the general planning of communications concerning health and well-being in order to ensure the consistency of messages, regardless of the group targeted.

It will maintain an ongoing exchange of information with government authorities, regional and local bodies, and network partners.

The Strategic Communications Coordination Unit will prepare a communications action plan designed to ensure the greatest consistency possible and to mobilize all authorities and partners toward a common goal.

It will also be responsible for gathering the comments and opinions of network resources as well as evaluating public opinion and the population’s perceptions regarding the issues in question, while monitoring international and national news.

The Strategic Communications Coordination Unit will be using a communications and information sharing management tool developed specifically for the fight against the influenza pandemic. Using an Internet protocol, the tool will connect the regions and the Ministère to ensure the dissemination of up-to-date information, 24 hours a day. Based on how the situations evolve, it will allow messages to be adjusted quickly and, if necessary, information and operations strategies to be adapted to ensure the consistency and accuracy of messages and actions.

Taking events into consideration, and depending on when the government deems the issue to be of national interest, the Strategic Communications Coordination Unit will remain under the responsibility of the Ministère; however, during a pandemic, communication leadership will be transferred to the Executive Council, in accordance with the Québec’s National Civil Protection Plan.

During the post-pandemic period, communication leadership will revert to the Ministère. The Strategic Communications Coordination Unit will then disseminate information concerning the steps leading to the resumption of activities. It will also notify the population and network stakeholders of the measures that have been planned to deal with a second wave of influenza.

Communications Operations Centre

Centred mainly on action, the Communications Operations Centre will meet the need for information on the influenza pandemic and to prepare information campaigns, in line with the plan produced by the Strategic Communications Coordination Unit. It will analyze and evaluate the various communication initiatives.

It will also be responsible for receiving, processing and following up on media requests for all of the network’s communication teams. It will identify, train and accompany Ministère spokespersons and support network spokespersons.

As soon as the emergency level warrants it, the Communications Operations Centre will operate 24 hours a day, seven days a week.

</table>
As previously mentioned, according to the current planning scenario, up to 35% of the population could be infected in the event of an influenza pandemic. According to this hypothesis, 2.6 million people would be infected, 1.4 million would need medical attention and 34,000 would be hospitalized. In this context, we will need to plan for additional workers in network establishments, private clinics and possibly at non-traditional healthcare sites, not to mention the additional resources required for mass vaccinations.

We would therefore need to inform, reassure and increase awareness among health and social services network personnel, while providing them the necessary support in terms of training, equipment, and preventive and security measures. In addition to that, we must create a pool of backup human resources in every field outside the network.

The Public Health Act and the Civil Protection Act allow the government to order measures to remove obstacles to putting in place actions to protect public health. The application of these special measures would be a last resort.

There will be three strategies for keeping the health and social services network operating during an influenza pandemic:

- Strategy No. 22: Manage worker movement
- Strategy No. 23: Manage the procurement of drugs, supplies and equipment
- Strategy No. 24: Use reliable information resources
STRATEGY NO. 22: MANAGE WORKER MOVEMENT

Each establishment must include in its three-year labour action plan a component covering the specific needs related to an influenza pandemic. This plan must also see to the optimal use of workers, both in terms of network personnel, and alternate human resources and volunteers, taking into account skills, abilities and knowledge. Furthermore, it must anticipate situations in which workers would be assigned to other tasks and special functions, at various sites, including non-traditional healthcare sites.

Each establishment must also have a strategy for gradually mobilizing human resources during each period of the influenza pandemic. Individuals who have recovered from a pandemic influenza strain will have acquired a natural immunity. Within the context of a personnel shortage, it might be necessary to assign these people to areas of high exposure.

“Alternate human resources” refers to “individuals who come from outside the health and social services network and who provide, during a pandemic period, services for a network establishment and for activities normally performed by the establishment’s personnel.”

**Anticipate personnel shortages**

By applying to the network the same hypothesis as for the general population, it is logical to think that 35% of the network’s personnel may be affected and rendered unavailable, which represents more than 81,000 people or 67,000 full-time equivalent workers (FTE). On a weekly basis, the apex would be reached in the sixth week, with more than 20,000 people affected (or 17,000 FTE).

</tbody>
</table>

During mass vaccinations, there will be a tremendous need for additional personnel. It should be remembered that each mass vaccination clinic will require 84 people in order to operate, based on the planned model. Therefore, between 3,500 and 12,500 people could be needed for all the clinics (27 to 93), including nurses (between 560 and 1,930) and vaccinators (between 430 and 1,500). In order to count on 84 people per clinic, eight hours per day for 30 days, we need to increase personnel by 60% for holidays, weekend rest, and so on.
Recruit alternate human resources

Each network establishment will have a list of people from all personnel categories—people who are willing to support regular personnel during an influenza pandemic. These volunteer resources include former network employers (retired or active), public service and agency employees, recent graduates, students, and personnel working outside the network.

For people who are former members of a professional order, the cooperation of professional orders will be crucial in better defining the profile of the people sought and drawing up a list.

For personnel categories not associated with a professional order, establishments must take steps to contact their former employees; paymasters can provide them with the last available contact information for these people if necessary.

The public service and education sectors will also be used as sources of alternate human resources likely to be from their sectors.

Alternate human resources who are from the public service sector (departments, organizations) or from the education sector (school boards, CEGEPS, universities) and who will be supporting the network’s workers will maintain their employment relationship, working conditions, compensation and fringe benefits with their original employers. They will remain the employees of these employers, but will be on loan to the health and social services network for a limited time.

The Commission administrative des régimes de retraite et d’assurances (CARRA) may also be asked to inform network retirees that they can volunteer through their professional order or their former employer, if applicable.

Compensation and working conditions for alternate human resources

Alternate human resources consist of employees, management staff and health professionals.

Status

People who are designated as employee or management alternate human resources are considered limited-time temporary workers whose working conditions are those of part-time employees or executives in the health and social services network, with the exception of life, health and salary insurance plans, which continue to be compensated as a percentage for the duration of their commitment.

Employees and working conditions

The working conditions applicable to employees are those covering national matters and stipulated in the collective agreement applicable to part-time workers, based on the personnel category in the Act respecting bargaining units in the social affairs sector, (Bill 30) (R.S.Q., chapter U-0.1).

As for the working conditions pertaining to local matters, they are defined by the employer, in accordance with Bill 30.
Management staff

The provisions governing compensation and bonuses in the legislation that stipulates the working conditions and compensation for part-time management staff apply.

However, the benefits applicable to part-time executives not covered by an insurance plan apply to alternate management human resources.

Health professionals

For active general practitioners and those who have retired but still have the right to practise

The compensation for physicians called upon to practise as part of public health activities is governed by the public health agreement.

This agreement sets out certain conditions with regard to practice and compensation for physicians practising for public health reasons. In accordance with this agreement, the activities for which compensation is provided are as follows:

- Activities during a disaster, catastrophe, or real or suspected epidemic;
- Dispensing of clinical services in exceptional or temporary circumstances (including the vaccination of target populations).

If general practitioners are called upon to dispense services in other sectors of activity, professional activities are compensated in accordance with the provisions outlined in the general agreement.

For active specialists and those who have retired but still have the right to practise

Community health specialists are compensated in accordance with the provisions stipulated in Appendix 14 of the general agreement.

For other specialists, professional activities are compensated in accordance with the provisions outlined in the general agreement.

For retired general practitioners and specialists who have the right to practise, the reimbursement of liability insurance premiums will be possible as long as they do not already have such coverage.

The agreements with the physicians’ federations will also apply.

Travel expenses and other working conditions

Alternate human resources who will need to travel to provide their services will have their travel and accommodation expenses reimbursed by the establishment requiring their services, in accordance with applicable rates.

Professional liability insurance

The liability insurance coverage that applies to regular employees will be extended to alternate human resources.

Occupational health and safety

Alternate human resources will enjoy the same protection measures as those provided to regular personnel.

</table>
The contribution of volunteers

Volunteers will also be called upon to perform tasks that do not require healthcare or social services training including, among other things, greeting and orienting people.

Making use of volunteers will initially involve determining the pool of people who can be mobilized, planning their contribution, creating a database of available people, keeping them informed and, lastly, organizing this category of resources.

The organization will consist of:

- Defining volunteers’ areas of action by describing the tasks expected;
- Developing an operating system for mobilization;
- Identifying the sources of volunteer recruitment in collaboration with area resources.

Skill maintenance and development

An influenza pandemic will require specific skills in terms of knowledge, know-how and behaviours for all network personnel, including physicians, alternate human resources and non-network partners.

Training needs will be identified based on the preparedness, response and recovery steps. As such, the Ministère identifies the national training needs and develops tools and a pedagogical development approach allowing for the acquisition of the required skills at the appropriate time. In addition, given its expertise and its important role in the field of skill development, the Institut national de santé publique du Québec (INS PQ) will be called upon to help.
Here are the main objectives being pursued for skill maintenance and development in the event of an influenza pandemic:

- Ensure that all stakeholders have the knowledge, know-how and behaviours that will allow them to fully play their role during each of the influenza pandemic periods, calling on the expertise of experts and the collaboration of health and social services agencies;
- Ensure the consistency of training material and minimize design and development efforts;
- Promote the designing of tools and a pedagogical approach allowing for the rapid acquisition of skills, taking into account the characteristics of the targeted clientele.

### STRATEGY NO. 23: MANAGE THE PROCUREMENT OF DRUGS, SUPPLIES AND EQUIPMENT

The Government of Québec may use specific powers in the event of a pandemic to protect public health. In this context, it may incur expenses and enter into contracts to procure, store and distribute medication, equipment and supplies that it deems necessary. It may make emergency purchases and circumvent the normal rules of procurement.

Obviously, in the event of an influenza pandemic, the procurement of non-critical products will follow the standards in effect in the network. As non-traditional healthcare sites will be under the umbrella of a healthcare establishment, they will be subject to the same administrative rules.

Out of concern for efficiency, the Ministère will coordinate procurement, providing appropriate, secure storage of critical products as well as a planned distribution and monitoring system, working with suppliers.
Manage the procurement of drugs, supplies and equipment

It is possible, depending on the severity of the influenza pandemic, that several countries will place embargoes on the products required. The transportation system for these products could also be subject to logistical and human weaknesses. It is therefore important that Québec plan an a priori procurement of resources that are essential to the health and social services network and non-traditional healthcare sites.

The procurement strategy for drugs, equipment and supplies required to fight an influenza pandemic sets out the following tasks:

- establish a formal list of essential products according to whether they are “critical” or “non-critical;
- establish agreements with suppliers and gather the reserves of critical products required for the entire influenza pandemic with suppliers and/or in central warehouses of the health network;
- establish local reserves of essential products needed to maintain the network’s activities and to start up non-traditional healthcare sites, for a period of seven days;
- enter into contracts with manufacturers and suppliers to be sure to have a supply of flu vaccines and antiviral drugs.

Store products appropriately to guarantee their availability

As critical reserves of products are built up, their storage will be under ministerial control in order to guarantee availability and security.

Scarce antiviral drugs will also have to be securely managed because they will be in great demand. The same applies to doses of the flu vaccine, whose the availability will be limited at the beginning of production.

Distribute according to the public and priority groups

The potential shortage of certain products, the increase in demand for others and the need for quick intervention to minimize the impact of the influenza pandemic will require careful coordination of distribution operations. Crucial products will be distributed so that the public will be served but also, in the case of antiviral drugs and influenza virus vaccines, according to the number of people in each region who are members of priority groups. Security measures will be put in place to protect the distribution of vaccines and antivirals, particularly in the event of shortages.

STRATEGY NO. 24: USE RELIABLE INFORMATION RESOURCES

In its preparations, the Ministère has considered the need to quickly deliver applications to support its activities and data gathering, and has therefore opted to reuse and adapt the existing systems of the RTSS (Réseau de telecommunications sociosanitaire). Since needs will undoubtedly evolve in line with the epidemiological situation and the threat level associated with the pandemic, information resources will be developed using open-ended applications.

Efforts will focus on three areas:

- access to the RTSS
- deployment of operations support tools
- deployment of decision support tools

Ministerial heads will also have access to a tracking system that compiles data from existing systems. The indicators required for tracking and assessing the situation will allow users to view and analyze data in real time.
IT specialists will provide support and share their expertise in data processing tools with the managers of the health and social services network.

The Ministère’s Information Resources Branch plans to suspend its regular activities during a pandemic in order to respond quickly to the department’s needs.

The telephone network can simultaneously process several inbound and outbound calls. All health and social services network authorities should have the phone numbers for non-traditional healthcare sites on hand.

In terms of IT communications, an RTSS connection will be required for each non-traditional healthcare site in order to allow each establishment’s internal applications to continue being used.

CONCLUSION

Influenza pandemics are a recurring event, and the risk of a fresh episode is on our doorstep. Through our preparations, we are working to reduce the potential impact of this phenomenon, even though we are unable to determine its onset or extent with certainty. In this context, every link in the chain is critical, which is the reason we want to build a comprehensive vision of our activities.

In dealing with a virulent infection and handling a large number of infected people, the health and social services network must be ready to provide the public with the expected healthcare and psychosocial assistance.

Institutions often distinguish themselves in emergency situations because they reveal unexpected aspects of their essence or because the people who work there simply surpass themselves.

It is our hope that the pandemic influenza plans currently being prepared by the government, agencies and establishments will inspire those who will one day be called upon to administer them, and that these plans will contribute to adequately serving the citizens who will turn to their health and social services network when the pandemic strikes.

Good luck to you all with your preparations!
APPENDIX A

COMPLEMENTARY INFORMATION ON THE INFLUENZA VIRUS AND INFECTIONS IN BIRDS

The influenza virus

Influenza, commonly called the flu, is caused by the influenza virus, an RNA virus with a fragmented genome belonging to the Orthomyxoviridae family. There are three types of influenza viruses: A, B and C. Only influenza A, which is genetically unstable, has the ability to mutate and cause pandemics.

There are different strains of the influenza A virus. The strains are classified according to the proteins found on the virus surface: hemagglutinin (H1 to H16) and neuraminidase (N1 to N9).

Transmission through contact: direct contact, with infected secretions, and indirect contact, with objects contaminated by infected secretions.

Transmission through droplets: projected 1 metre or less by coughs and sneezes.

Airborne transmission: non-standard mode of transmission and under special circumstances.

Asymptomatic individuals.

Virus survival: 5 minutes on hands, 8 to 12 hours on clothing and paper, 24 to 48 hours on hard surfaces. Incubation period: short, from 1 to 3 days. Contagiosity: 24 hours before symptoms begin and up to 7 days after symptoms begin.

From seasonal human influenza to an influenza pandemic

Every year, the influenza virus undergoes minor changes that are called “antigenic drift.” This process provokes seasonal influenza epidemics. A vaccine is produced annually and adjusted to the strains that are circulating. Each season, influenza can affect between 5% and 20% of the population. Vulnerable populations include the elderly, young children and individuals with a chronic disease. Every year in Québec, the flu causes 1,000 to 1,500 deaths.

About three occurrences per century

Major changes, called “antigenic shift,” occur and cause an influenza pandemic once every 30 to 40 years. A pandemic is an epidemic on a global scale. During an influenza pandemic, up to 50% of the population may be infected. There is an increase in complications and mortality. This increase can affect a healthy population.

The pandemics of the 20th century: 1918 – the Spanish flu: H1N1, 20 to 40 million deaths, particularly among individuals 20 to 40 years of age; 1957 – the Asian flu: H2N2, 2 million deaths; 1968 – the Hong Kong flu: H3N2, 1 million deaths.
